SIMULATION AND MODELING: ASSIGNMENT 3

Testing Random Number Generators

Afsara Benazir Roll - 1505118

December 12, 2020

$$seed = 1505118$$
$$alpha = 0.1$$

1 Distribution of generated Random numbers

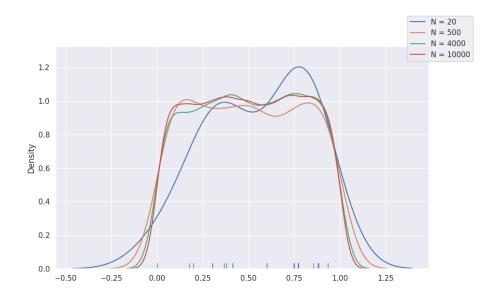

Figure 1: Distribution of generated Random numbers

2 Uniformity Test

A Uniformity Statistic is a means of measuring the extent to which a sample conforms to a uniform distribution.

The null hypothesis i.e U_i 's are IID random variables is rejected when $\chi^2 > \chi^2_{k-1,1-\alpha}$ at level α where $\chi^2_{k-1,1-\alpha}$ is the upper $1-\alpha$ critical point of the chi-square distribution with k-1 degrees of freedom.

| n | k | χ^2 | $\chi^2_{k-1,1-lpha}$ | Rejected |
|-------|----|----------|-----------------------|----------|
| 20 | 10 | 12.0 | 14.68366 | NO |
| | 20 | 28.0 | 27.20357 | YES |
| 500 | 10 | 3.16 | 14.68366 | NO |
| | 20 | 8.4 | 27.20357 | NO |
| 4000 | 10 | 4.705 | 14.68366 | NO |
| | 20 | 12.09 | 27.20357 | NO |
| 10000 | 10 | 5.794 | 14.68366 | NO |
| | 20 | 11.044 | 27.20357 | NO |

3 Serial Test

The serial test is a generalization of the chi-square test to higher dimensions. This uniformity in higher dimensions matters because if the individual U_i 's are correlated, the distribution of the d-vectors U_i will deviate from the d-dimensional uniformity; thus, the serial test provides an indirect check on the assumption that the individual U_i 's are independent.

Here a matrix of size k^d is generated which is why we keep values of d smaller i.e 2 and 3.

| n | d | k | χ^2 | $\chi^2_{k^d-1,1-\alpha}$ | Rejected? |
|-------|---|---|-----------|---------------------------|-----------|
| 20 | 2 | 4 | 15.6 | 22.30713 | NO |
| | 2 | 8 | 66.8 | 77.74538 | NO |
| | 3 | 4 | 58.0 | 77.74538 | NO |
| | 3 | 8 | 506.0 | 552.37393 | NO |
| 500 | 2 | 4 | 13.68 | 22.30713 | NO |
| | 2 | 8 | 62.32 | 77.74538 | NO |
| | 3 | 4 | 50.67470 | 77.74538 | NO |
| | 3 | 8 | 487.87952 | 552.37393 | NO |
| 4000 | 2 | 4 | 17.31200 | 22.30713 | NO |
| | 2 | 8 | 74.04800 | 77.74538 | NO |
| | 3 | 4 | 52.29032 | 77.74538 | NO |
| | 3 | 8 | 494.14479 | 552.37393 | NO |
| 10000 | 2 | 4 | 13.65120 | 22.30713 | NO |
| | 2 | 8 | 76.63360 | 77.74538 | NO |
| | 3 | 4 | 62.60996 | 77.74538 | NO |
| | 3 | 8 | 517.67627 | 552.37393 | NO |

4 Runs Test

The third empirical test - the runs (or runs-up) test, is a direct test of the independence assumption. We do not test the uniformity here.

Run-up: unbroken subsequences of maximal length within which the U_i 's increase monotonically

Run up array:

$$\begin{array}{ll} n & r \\ 20 & [2,1,2,0,2,0] \\ 500 & [80,103,44,13,6,0] \\ 4000 & [651,818,385,100,22,8] \\ 10000 & [1627,2088,937,247,59,17] \end{array}$$

| n | R | $\chi^2_{6,1-lpha}$ | Rejected |
|-------|----------|---------------------|----------|
| 20 | 33.68708 | 10.64464 | YES |
| 500 | 4.18046 | 10.64464 | NO |
| 4000 | 6.23016 | 10.64464 | NO |
| 10000 | 6.41907 | 10.64464 | NO |

5 Correlation Test

In this test we directly assess whether the generated U_i 's exhibit discernible correlation at lag j.

Under the assumption that there is no correlation and assuming n is large A_j should have an approximate standard normal distribution. We test the null hypothesis i.e U_i 's have zero lag j correlation at level α and reject the hypothesis if $|A_j| > z_{1-\alpha/2}$.

| n | j | A_j | $z_{1-lpha/2}$ | Rejected |
|-------|---|---------|----------------|----------|
| 20 | 1 | 0.00451 | 1.0440 | NO |
| 20 | 1 | 0.93451 | 1.64485 | NO |
| | 3 | 1.00042 | 1.64485 | NO |
| | 5 | 0.56386 | 1.64485 | NO |
| 500 | 1 | 0.50991 | 1.64485 | NO |
| | 3 | 0.01297 | 1.64485 | NO |
| | 5 | 1.32214 | 1.64485 | NO |
| 4000 | 1 | 0.61936 | 1.64485 | NO |
| | 3 | 0.51350 | 1.64485 | NO |
| | 5 | 0.32983 | 1.64485 | NO |
| 10000 | 1 | 0.14678 | 1.64485 | NO |
| | 3 | 0.26231 | 1.64485 | NO |
| | 5 | 0.01205 | 1.64485 | NO |
